

# CHAPTER 6

## FLOW CONTROL INSTRUCTIONS

**TITLE IBM CHARACTER DISPLAY**

**.MODEL SMALL**

**.STACK 100H**

**.CODE**

**MAIN PROC**

**MOV AH, 2 ; display char function**

**MOV CX, 256 ; no. of chars to display**

**MOV DL, 0 ; DL has ASCII code of null char**

**PRINT\_LOOP:**

**INT 21h ; display a char**

**INC DL ; increment ASCII code**

**DEC CX ; decrement counter**

**JNZ PRINT\_LOOP ; keep going if CX not 0**

**; DOS exit**

**MOV AH, 4CH**

**INT 21H**

**MAIN ENDP**

**END MAIN**

# Conditional Jumps

- **Jxxx      destination\_label**
- In IBM.ASM, the CPU executes JNZ PRINT\_LOOP by inspecting ZF.
- If ZF = 0, control transfers to PRINT\_LOOP
- If ZF = 1, it goes on to execute MOV AH, 4CH
- Jump instructions themselves do not affect the flags.

# Range of a conditional jump

- `destination_label` must precede the jump instruction by no more than 126 bytes, or follow it by no more than 127 bytes.

# The CMP (compare) Instruction

- **CMP      destination, source**
- CMP is just like SUB, except that destination is not changed.
- `CMP      AX, BX      ; AX = 7FFFh, BX = 0001h`  
`JG          BELOW      ; AX – BX = 7FFEh`
- The jump condition for JG is satisfied because  $ZF = SF = OF = 0$ , so control transfers to label BELOW.

# Interpreting the Conditional Jumps

- `CMP      AX, BX`  
`JG          BELOW`
- If AX is greater than BX (in a signed sense), then JG (jump if greater than) transfers to BELOW.
- `DEC        AX`  
`JL          THERE`
- If the contents of AX, in a signed sense, is less than 0, control transfers to THERE.

# Jumps Based on Specific Flags

| Mnemonic | Description              | Flags  |
|----------|--------------------------|--------|
| JZ       | Jump if zero             | ZF = 1 |
| JNZ      | Jump if not zero         | ZF = 0 |
| JC       | Jump if carry            | CF = 1 |
| JNC      | Jump if not carry        | CF = 0 |
| JO       | Jump if overflow         | OF = 1 |
| JNO      | Jump if not overflow     | OF = 0 |
| JS       | Jump if signed           | SF = 1 |
| JNS      | Jump if not signed       | SF = 0 |
| JP       | Jump if parity (even)    | PF = 1 |
| JNP      | Jump if not parity (odd) | PF = 0 |

# Jumps Based on Unsigned Comparisons

| Mnemonic | Description  |
|----------|--|
| JA       | Jump if above (if $leftOp > rightOp$ )             |
| JNBE     | Jump if not below or equal (same as JA)            |
| JAE      | Jump if above or equal (if $leftOp \geq rightOp$ ) |
| JNB      | Jump if not below (same as JAE)                    |
| JB       | Jump if below (if $leftOp < rightOp$ )             |
| JNAE     | Jump if not above or equal (same as JB)            |
| JBE      | Jump if below or equal (if $leftOp \leq rightOp$ ) |
| JNA      | Jump if not above (same as JBE)                    |

# Jumps Based on Signed Comparisons

| Mnemonic | Description   |
|----------|---|
| JG       | Jump if greater (if <i>leftOp</i> > <i>rightOp</i> )                    |
| JNLE     | Jump if not less than or equal (same as JG)                             |
| JGE      | Jump if greater than or equal (if <i>leftOp</i> $\geq$ <i>rightOp</i> ) |
| JNL      | Jump if not less (same as JGE)  |
| JL       | Jump if less (if <i>leftOp</i> < <i>rightOp</i> )                       |
| JNGE     | Jump if not greater than or equal (same as JL)                          |
| JLE      | Jump if less than or equal (if <i>leftOp</i> $\leq$ <i>rightOp</i> )    |
| JNG      | Jump if not greater (same as JLE)                                       |

# Signed Versus Unsigned Jumps

- `CMP AX, BX ; AX = 7FFFh, BX = 8000h`  
`JA BELOW`
- `7FFFh > 8000h` in a signed sense, the program does not jump to `BELOW`.
- `7FFFh < 8000h` in an unsigned sense, and we are using the unsigned jump `JA`.

Suppose AX and BX contain signed numbers.  
Write some code to put the biggest one in CX.

```
MOV CX, AX      ; put AX in CX
CMP  BX, CX     ; is BX bigger?
JLE  NEXT       ; no, go on
MOV  CX, BX     ; yes, put BX in CX
```

NEXT:

# The JMP Instruction

- **JMP      destination**
- JMP can be used to get around the range restriction of a conditional jump.

# Unconditional Jump

TOP:

; body of the loop

DEC CX ; decrement counter

JNZ TOP ; keep looping if CX > 0

MOV AX, BX

; the loop body contains so many instructions  
that label TOP is out of range for JNZ  
(more than 126 bytes before JMP TOP)

# Unconditional Jump

TOP:

; body of the loop

DEC CX ; decrement counter

JNZ BOTTOM ; keep looping if CX > 0

JMP EXIT

BOTTOM:

JMP TOP

EXIT:

MOV AX, BX

# High level language constructs

# IF-THEN

IF condition is true

THEN

execute true-branch statements

END\_IF

Replace the number in AX by its absolute value.

IF AX < 0

THEN

replace AX by  $-AX$

END\_IF

Replace the number in AX by its absolute value.

```
; if AX < 0
    CMP AX, 0          ; AX < 0 ?
    JNL END_IF        ; no, exit
; then
    NEG AX             ; yes, change sign
END IF:
```

# IF-THEN-ELSE

IF condition is true

THEN

execute true-branch statements

ELSE

execute false-branch statements

END\_IF

Suppose AL and BL contain extended ASCII characters. Display the one that comes first in the character sequence.

```
IF AL <= BL
```

```
    THEN
```

```
        display the character in AL
```

```
    ELSE
```

```
        display the character in BL
```

```
END_IF
```

Suppose AL and BL contain extended ASCII characters. Display the one that comes first in the character sequence.

```
        MOV     AH, 2             ; prepare to display
; if AL <= BL
        CMP     AL, BL           ; AL <= BL?
        JNBE    ELSE_            ; no, display char in BL
; then                                     ; AL <= BL
        MOV     DL, AL           ; move char to be displayed
        JMP     DISPLAY          ; go to display
ELSE_:   ; BL < AL
        MOV     DL, BL
DISPLAY:
        INT     21h             ; display it
END_IF
```

**ELSE is a  
reserved word**

**Needed to skip false  
branch (not needed in  
high level language)**

# CASE

# Looping Structures

- A loop is a sequence of instructions that is repeated .
- The number of times to repeat may be known in advance  
or
- Depend on some condition

# FOR LOOP

Loop statements are repeated a known number of times;

```
FOR loop_count times DO  
    statements  
END_FOR
```

# The LOOP instruction

- **LOOP     destination\_label**  
; initialize CX to loop\_count  
TOP:  
    ; body of the loop  
    LOOP TOP

# The LOOP instruction

- The counter for the loop is the register CX which is initialized to loop\_count.
- Execution of the LOOP instruction causes CX to be decremented automatically.
- If CX is not 0, control transfers to destination\_label.
- If CX = 0, the next instruction after LOOP is done.

Write a count-controlled loop to display a row of 80 stars.

```
FOR 80 times DO
